

## <u>MEMORANDUM</u>

To: Angel Pinero, PE

From: Craig W. Peregoy, PE

Date: August 12, 2025

Re: Proposed Multi-Family Residential Conversion

Waterside Landing 5600 Lakeside Drive

City of Margate, Broward County, FL

**Parking Memorandum** 

Dynamic Traffic has prepared the following parking assessment to determine the appropriate parking supply to support the parking demand generated by the proposed conversion of an existing Assisted Living Facility to a multi-family residential building. The site is located at 5600 Lakeside Drive, south of Coconut Creek Parkway, in the City of Margate, Broward County, Florida. The site is currently developed with an assisted living facility with 217 parking spaces. It is proposed to convert the building to a 174-Unit multi-family residential development consisting of approximately 75% one-bedroom units (132 units) and 25% two-bedroom units (42 units). The project will be supported by an expanded parking supply. This assessment presents an evaluation of the proposed development to determine an appropriate parking supply.

#### **Local Ordinance Parking Requirements**

The Margate Ordinance parking schedule identifies a requirement of two (2) parking spaces for each dwelling unit of two (2) bedrooms or less which equates to a base requirement of 348 parking spaces. Additionally, the Ordinance allows a 5% reduction in the parking requirement for multifamily developments with 100 or more units. Therefore, the base parking ratio is reduced to 331 parking spaces. The Ordinance also specifies a guest parking requirement of 15% for developments with more than eight (8) dwelling units which equates to a guest parking requirement of 50 spaces. This results in a total requirement of 381 parking spaces. The following sections detail the national and existing parking demands in support of deviating from the Ordinance.

#### ITE Parking Demand

National parking demand data has been collected by the Institute of Transportation Engineers (ITE) within their publication *Parking Generation, 5<sup>th</sup> Edition.* This publication establishes peak parking demands for multiple land uses based upon different independent variables. For Land Use Code (LUC) 220 – <u>Multi-Family Housing – 2+BR (Low-Rise)</u>, ITE sets forth the average peak demand as well as a 95 percent confidence interval based on both the number of units and the number of bedrooms for a typical weekday, a Saturday and a Sunday. From each of these data points, the maximum calculated parking demand is the high end of the 95 percent confidence interval for weekdays which is 1.32 vehicles per dwelling unit. Consequently, the ITE parking demand data calculates a demand of up to 230 spaces for the site.

#### **ULI Parking Demand**

National parking demand data has also been collected by the Urban Land Institute (ULI), a non-profit education and research institute whose mission is to provide responsible leadership in the use of land in order to enhance the total environment. This data is compiled within their publication *Shared Parking, 3<sup>rd</sup> Edition.* This publication documents temporal distributions of parking demands throughout the day, week, and year for individual land uses, as well as peak parking demands. For a Residential Development in a suburban setting, the ULI calculates a demand of 188 parking spaces for residents and 18 spaces for guests on weekdays and 26 spaces for guests on weekends. Consequently, the ULI parking demand data calculates a demand of up to 214 spaces for the site.

#### **Census Data**

Reference was made to US Census data for the specific census tract in which the project is located (Tract 201.03; Broward County, FL). Based on census data, renter-occupied dwellings have a vehicle availability of 1.23 vehicles per unit which equates to a demand of 214 parking spaces. In fact, owner-occupied dwellings, which would include single-family homes with larger families than would be accommodated at the subject property, have a vehicle availability of 1.6 vehicles per unit which would equate to a demand of only 278 parking spaces.

#### Conclusion

The Applicant proposes to convert the existing Assisted Living Facility to a multi-family residential development with 174 dwelling units containing approximately 75% one-bedroom units and 25% two-bedroom units. The project will be supported by additional parking spaces (subject to final design), which will not meet the Ordinance parking requirement of 381 spaces. Dynamic Traffic has performed three separate parking analyses in order to assess the anticipated parking demand. The results of the parking analyses are detailed in the table below.

**Table 1 – Parking Analysis Summary** 

Douking Critorio	Parking Demand/Requirement							
Parking Criteria	Weekday	Weekend						
Local Ordinance	381	381						
ITE Average Peak Demand (Units)	221	205						
ITE 95 <sup>th</sup> % Confidence (Units)	230	-						
ITE Average Peak Demand (BDR's)	147	173						
ITE 95 <sup>th</sup> % Confidence (BDR's)	153	-						
ULI Parking Demand	206	214						
Census Data (Renter)	214	214						
Census Data (Owner)	278	278						
Average of All Sources	229	244						

Based upon our Parking Assessment as detailed in the body of this report, it is the professional opinion of Dynamic Traffic that the deviation from the Ordinance required parking supply can be granted with no detrimental impact to the proposed lot or adjacent properties. Based on the assessment above which conservatively considers higher than anticipated parking demands based on the ordinance requirement and based on Owner-Occupied Census data, a parking supply of approximately 250 parking spaces will be more than adequate to accommodate the proposed redevelopment. Should you have any questions on the above, please do not hesitate to contact me.

Sincerely,

Dynamic Traffic, LLC

## Land Use: 220 Multifamily Housing— 2+ BR (Low-Rise)

#### **Description**

Low-rise multifamily housing with two-or-more bedrooms is a residential building with two or three floors (levels) of residence that contain at least one dwelling unit with two or more bedrooms.

Various configurations can fit this description, including the following:

- Walkup apartment or multiplex-access to the individual dwelling units is typically internal to the structure and provided through a shared entry, stairway, and hallway
- Mansion apartment-several dwelling units within what appears from the outside to be a singlefamily dwelling unit
- Stacked townhouse-designed to match the external appearance of a townhouse, but which have dwelling units that share both floors and walls and with access through a central entry and stairway

#### Land Use Subcategory

Data are separated into two subcategories for this land use: (1) not close to rail transit and (2) close to rail transit. A site is considered close to rail transit if the walking distance between the residential site entrance and the closest rail transit station entrance is ½ mile or less.

## **Time-of-Day Distribution for Parking Demand**

The following table presents a Time-of-Day distribution of parking demand (1) on a weekday (13 study sites) and a Saturday (eight study sites) in a general urban/suburban setting and (2) on a weekday (three study sites) and a Saturday (three study sites) in a dense multi-use urban setting.

Hour Beginning 12:00-4:00 a.m. 5:00 a.m. 6:00 a.m. 7:00 a.m		Percent of Peak	Parking Demand				
	General Urb	an/Suburban	Dense Multi-Use Urban				
	Weekday	Saturday	Weekday	Saturday

10:00 p.m.	92	82	74	76			
11:00 p.m.	95	88	84	86			

#### **Additional Data**

The average parking supply ratios and average peak parking occupancy for the study sites with parking supply information are shown in the table below.

Setting	Proximity to Rail Transit	Parking Supply Per Dwelling Unit	Average Peak Parking Occupancy
Dense Multi-	Within ½ mile of rail transit	1.2 (21 sites)	73%
Use Urban	Not within ½ mile of rail transit	1.3 (18 sites)	70%
General Urban/	Within ½ mile of rail transit	1.6 (31 sites)	72%
Suburban	Not within ½ mile of rail transit	1.7 (114 sites)	72%

The sites were surveyed in the 1990s, the 2000s, the 2010s, and the 2020s in Alberta (CAN), Arizona, California, Colorado, District of Columbia, Maine, Maryland, Massachusetts, New Jersey, Ontario (CAN), Oregon, Pennsylvania, Tennessee, Virginia, Washington, and Wisconsin.
