EXECUTIVE SUMMARY

Kimley-Horn and Associates has prepared a traffic study to evaluate the impact of redevelopment of portions of the Carolina Club golf course, bound to the north by Sample Road, the east by Rock Island Road, and the west and south by Holiday Springs Boulevard. The site is currently vacant. The currently proposed plan would redevelop portions of the site with 57,500 square feet of commercial use, 507 multi-family mid-rise residential units, and 377 single-family attached residential units.

A site-specific traffic analysis has been undertaken to evaluate impacts on the surrounding transportation network. For this analysis, the trip generation potential has been calculated for the proposed plan of development, and these project trips have been distributed on the surrounding transportation network in the vicinity of the site. An analysis was also conducted to review the signalized and unsignalized intersection operations at the following intersections in the vicinity of the site using Synchro 12 software. The study intersections are listed below:

1. Sample Road & Riverside Drive
2. Sample Road & Holiday Springs Boulevard/Woodside Drive
3. Sample Road & Pod B Road
4. Sample Road & Rock Island Road
5. Pinewalk Drive North & Rock Island Road
6. Pinewalk Drive North & Pod A Road
7. Pod B Road & Holiday Springs Boulevard
8. Pod C Road & Pinewalk Drive North
9. NW 30th Street & Rock Island Road
10. Pinewalk Drive South & Pinewalk Drive North
11. Pinewalk Drive South & Rock Island Road
12. Holiday Springs Boulevard & Pinewalk Drive South
13. Holiday Springs Boulevard & Rock Island Road
14. Royal Palm Boulevard & Rock Island Road
15. Royal Palm Boulevard & Riverside Drive

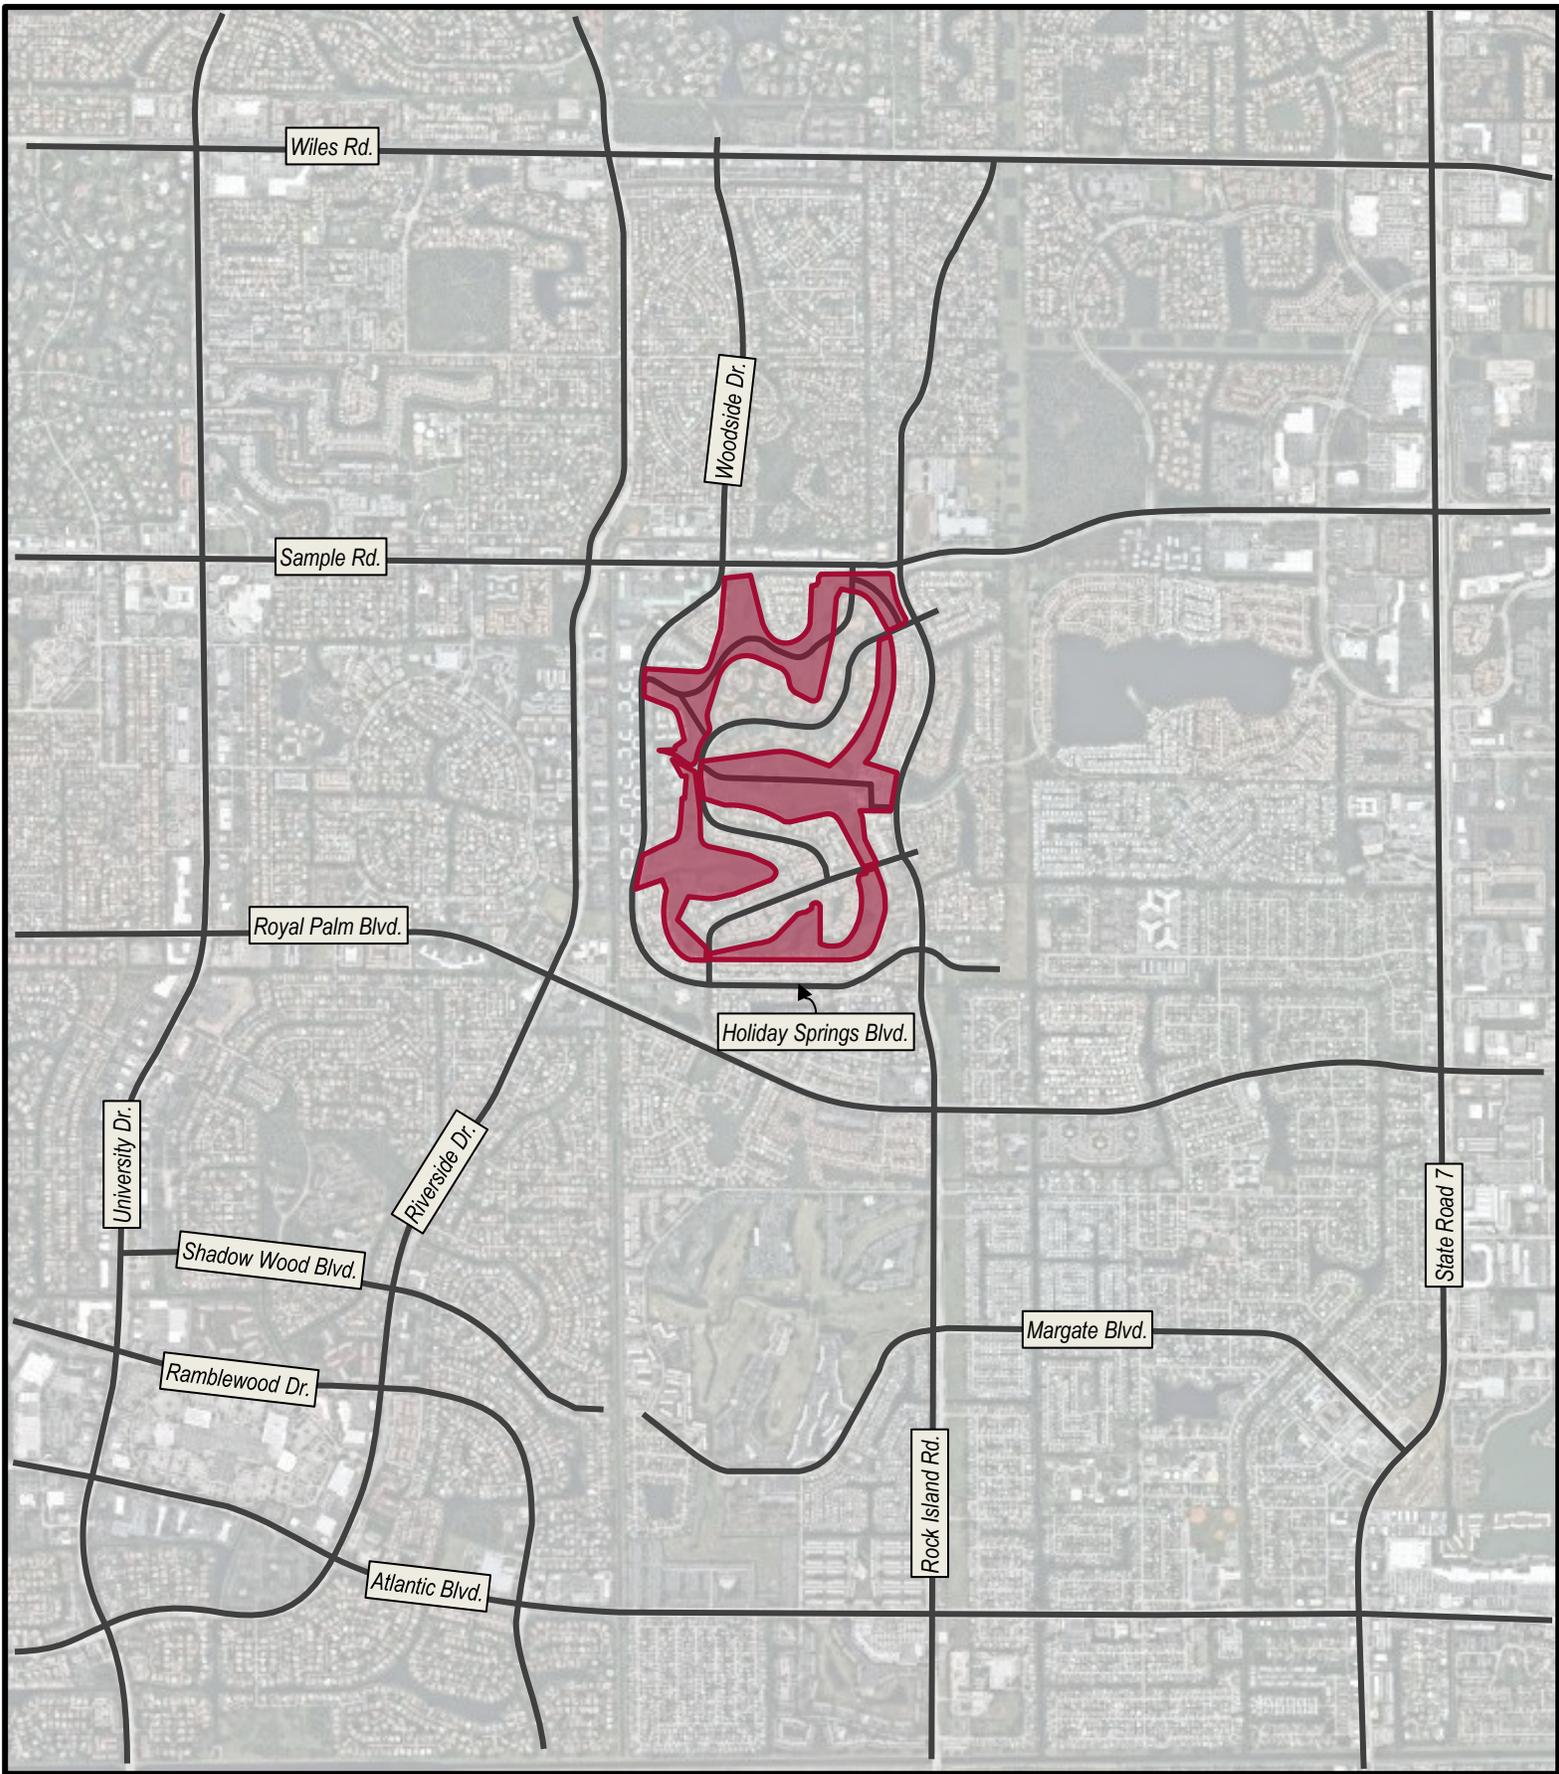

In addition, Level of Service (LOS) and delay have been evaluated for each of the study intersections. The analysis identifies existing LOS and delay, future background LOS and delay, and total future LOS and delay upon buildout of the project. The results of the evaluation are used to determine conditions of approval that will be implemented to mitigate traffic impacts generated by the project on the surrounding transportation network.

INTRODUCTION

The Carolina Club site is bound on the north by Sample Road, on the east by Rock Island Road, and on the west and south by Holiday Springs Boulevard. Figure 1 illustrates the location of the project site. The site is currently vacant and is proposed to be redeveloped with 57,500 square feet of commercial use, 507 multi-family mid-rise residential units, and 377 single family attached residential units.

Kimley-Horn and Associates, Inc. was retained to prepare a traffic impact analysis to evaluate the impacts resulting from the proposed program of development. This document presents the methodology used and the findings of the traffic impact analysis. For the purposes of this traffic analysis, a buildout date of 2030 was assumed.

A conceptual site plan and study methodology can be found in Appendix A.

INVENTORY AND PLANNING DATA

To evaluate the traffic conditions on the surrounding network, intersection turning movement counts were performed during the AM peak (7:00 a.m. to 9:00 p.m.) and PM peak (4:00 p.m. to 6:00 p.m.) periods on Wednesday December 13, 2023 and Thursday February 29, 2024 at the intersections listed below:

1. Sample Road & Riverside Drive
2. Sample Road & Holiday Springs Boulevard/Woodside Drive
3. Sample Road & Belmonte Boulevard
4. Sample Road & Rock Island Road
5. Pinewalk Drive North & Rock Island Road
6. NW 30th Street & Rock Island Road
7. Pinewalk Drive South & Pinewalk Drive North
8. Pinewalk Drive South & Rock Island Road
9. Holiday Springs Boulevard & Pinewalk Drive South
10. Holiday Springs Boulevard & Rock Island Road
11. Royal Palm Boulevard & Rock Island Road
12. Royal Palm Boulevard & Riverside Drive

Figure 2 illustrates the intersections where data was collected in addition to the new access connections proposed as part of the redevelopment program.

The volumes were collected in 15-minute intervals, and the peak hour was determined for each intersection. The turning movement counts are provided in Appendix B. Signal timing summaries are provided in Appendix C.

 Project Intersections

EXISTING (2024) TRAFFIC

Because some of the turning movement counts were collected outside the period that is the “peak season” in South Florida (generally January through March), a peak season adjustment factor was applied to the existing turning movement volume counts, where applicable. The peak season factor was taken from the Peak Season Conversion Factor report published by the Florida Department of Transportation for the area of Broward County west of US 441. A copy of the Peak Season Conversion Factor report is included in Appendix D.

The application of this factor to calculate Existing Peak Season traffic volumes is included in the volume development worksheets provided in Appendix E. Figure 3 provides a summary of the existing peak season traffic volumes at the study intersections.

BACKGROUND TRAFFIC

Background traffic is defined as the traffic expected to be on the roadways during the buildout year (2030) without traffic generated by the project. It includes traffic volumes based on existing counts, adjusted using an annually-compounding growth rate. This yearly growth rate was determined by analyzing AADT data collected at several FDOT portable traffic monitoring sites on the roadways that surround the site and taking a weighted average of the growth on roadway links outside of the residential community. The AADT data worksheets and growth rate calculation can be found in Appendix D. As shown in those calculations, the three-year weighted average growth rate is negative; therefore, an annual growth rate of 1% was applied in these calculations.

The application of the growth rates to calculate Background Year 2030 traffic volumes is included in the volume development worksheets provided in Appendix E. Figure 4 provides a summary of the future background traffic volumes at the study intersections.

PROJECT TRAFFIC

Project traffic used in this analysis is defined as the vehicle trips expected to be generated by the project, and the distribution and assignment of that traffic over the study roadway network.

Trip Generation

The trip generation potential of the development was calculated based upon the trip generation rates and equations published by the Institute of Transportation Engineers (ITE) in Trip Generation Manual, 11th Edition. The relevant excerpts from the ITE manual are included in Appendix D for reference. The trip generation potential for the proposed uses is calculated using rates and equations published for the following land uses:

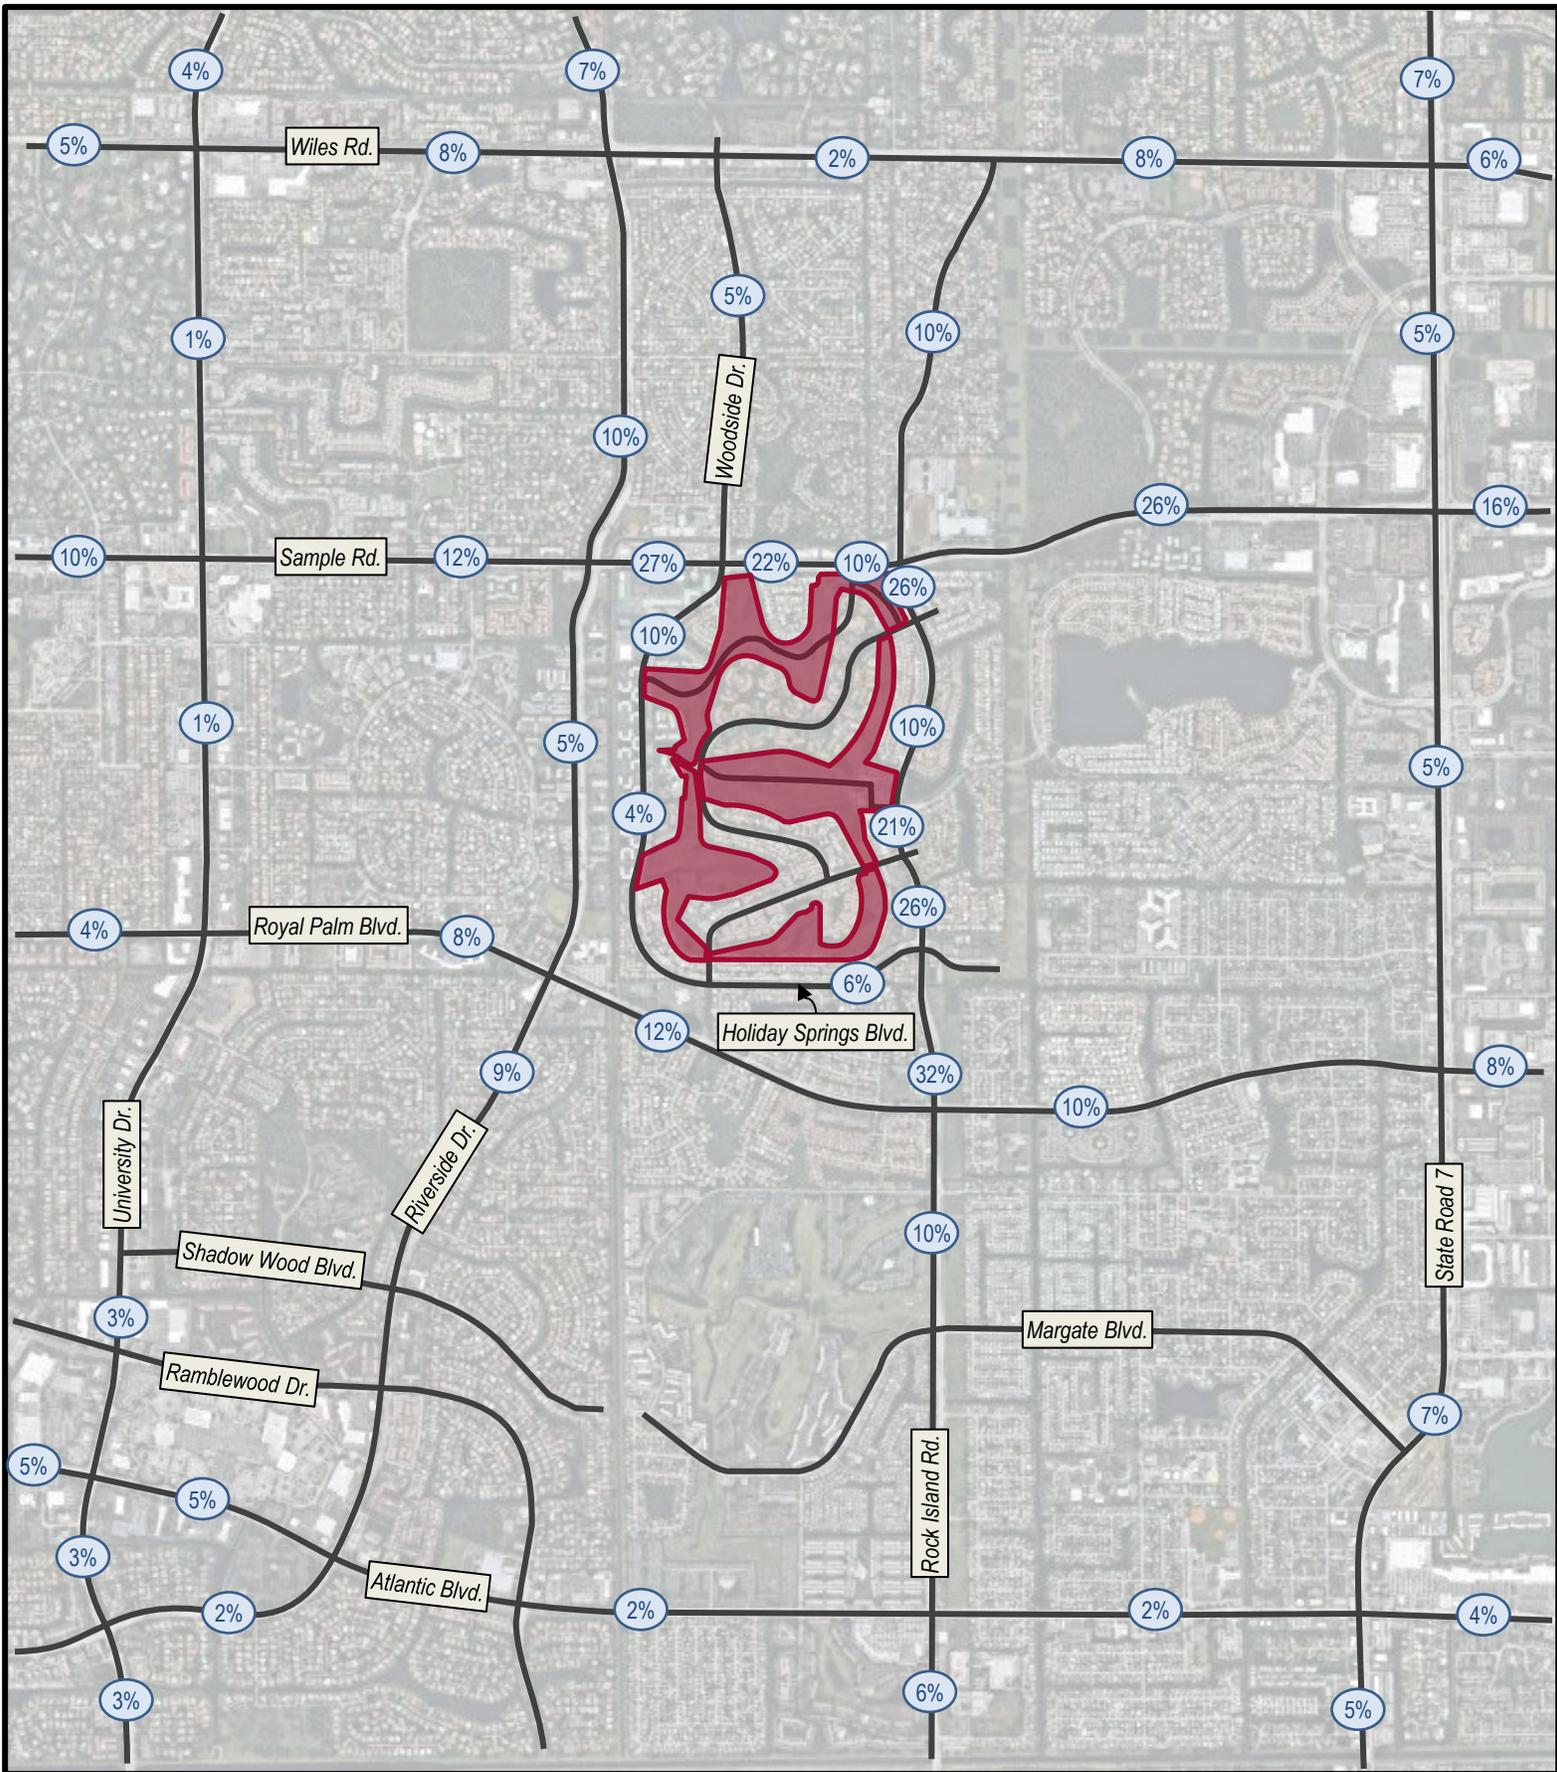

- Single Family Attached Housing (Land Use 220)
- Multi-family Mid-Rise (Land Use 221)
- Shopping Plaza w/ Supermarket (Land Use 821)

As indicated in Table 1, the net new trip generation potential of the proposed site is 7,902 net external daily trips, 594 net new external AM peak hour trips (+218 in, +376 out) and 579 net new external PM peak hour trips (+316 in, +263 out).

The site traffic was assigned to the surrounding roadway network based upon travel patterns for this area and proximity to complimentary land uses. Figure 5 illustrates the overall project distribution on the surrounding roadways. Figure 6 illustrates the project distribution at each of the study intersections. This distribution was then applied to the net new traffic generation of the site to determine net new project traffic volumes at each of the study intersections. The resulting AM and PM project traffic volumes are illustrated in Figure 7.

TOTAL FUTURE TRAFFIC

Total future traffic is defined as the traffic expected to be on the roadways during the buildout year (2030) including the project traffic generated by development of this site. It includes the future background traffic volumes as the baseline, with project traffic assigned at each of the study intersections.

The determination of the Future Year 2030 traffic volumes at each of the study intersections are included in the volume development worksheets provided in Appendix E. Figure 8 provides a summary of the future total traffic volumes at the study intersections.

Location	Direction	A.M. Peak Hour Traffic	P.M. Peak Hour Traffic

INTERSECTION ANALYSIS

Operational analyses were conducted to determine the level of service and delay at all the study intersections. The analyses were conducted for three conditions (Existing 2024, Background Year (2030), and Future Total (2030)) during the weekday AM and PM peak hours at the following intersections:

1. Sample Road & Riverside Drive
2. Sample Road & Holiday Springs Boulevard/Woodside Drive
3. Sample Road & Pod B Road
4. Sample Road & Rock Island Road
5. Pinewalk Drive North & Rock Island Road
6. Pinewalk Drive North & Pod A Road
7. Pod B Road & Holiday Springs Boulevard
8. Pod C Road & Pinewalk Drive North
9. NW 30th Street & Rock Island Road
10. Pinewalk Drive South & Pinewalk Drive North
11. Pinewalk Drive South & Rock Island Road
12. Holiday Springs Boulevard & Pinewalk Drive South
13. Holiday Springs Boulevard & Rock Island Road
14. Royal Palm Boulevard & Rock Island Road
15. Royal Palm Boulevard & Riverside Drive

The intersection analyses use the methodologies outlined in the Highway Capacity Manual, 7th Edition to determine the overall intersection level of service (LOS) and delay during the three analysis conditions during AM and PM peak hours. Using Trafficware's Synchro 12, software models were developed to determine the LOS and delay at the signalized and unsignalized intersections. The Synchro output worksheets are included in Appendix G.

Summary tables have been prepared to document the level of service and delay at the intersections for the Existing, Background Year, and Future Total conditions. Table 2 summarizes the results for the Existing (2024) AM and PM peak hour analyses, Table 3 summarizes the results for the Background Year (2030) AM and PM peak hour analyses, and Table 4 summarizes the results for the Future Total (2030) AM and PM peak hour analyses.

Existing (2024)

As illustrated in Table 2, the following intersection currently operates at LOS F during existing conditions:

- Riverside Drive & Royal Palm Boulevard (AM and PM Peak Hour)

Table 2: Existing (2024) Peak Hour Intersection LOS and Delay

Background Year (2030)

As summarized in Table 3 the following intersections are expected to operate at LOS F during future background (non-project) conditions:

- Rock Island Road & Pinewalk Drive North (AM Peak Hour)
- Rock Island Road & NW 30th Street (AM Peak Hour)
- Riverside Drive & Royal Palm Boulevard (AM and PM Peak Hour)

These intersections are expected to operate at LOS F if no improvements are made due to the addition of ambient traffic growth in the area.

Future Total (2030)

As summarized in Table 4, the following intersections are expected to operate at LOS F in future 2030 conditions:

- Rock Island Road & Pinewalk Drive North (AM and PM Peak Hour)
- Rock Island Road & NW 30th Street (AM Peak Hour)
- Riverside Drive & Royal Palm Boulevard (AM and PM Peak Hour)

These intersections are expected to operate at LOS F without the addition of project traffic and therefore is not a deficiency caused by the addition of project traffic.

Table 4: Future Total (2030) Peak Hour Intersection LOS and Delay

95th Percentile Queueing Analysis

A 95th percentile queue analysis was conducted to evaluate each analyzed intersection's storage lengths during AM and PM peak hours during the future year conditions with the addition of project traffic. *Synchro 12* software and the *HCM 2000* Edition methodology were used to determine the resulting 95th percentile queues at each of the study intersections. Table 5 summarizes the future no build and future build queue lengths. As shown in this table, there are several movements that exceed their respective storage during both scenarios. These deficiencies are expected to occur without the addition of project traffic and therefore is not the responsibility of the proposed project.

Table 5: 95th Percentile Queue Analysis

#	Intersection	Movement	Storage	Future - No Build		Future - Build

LOCAL ROADWAY LOS ANALYSIS

In addition to the analyses undertaken on the surrounding intersection network, an evaluation has been undertaken to review potential traffic impacts generated by the proposed development on the surrounding local road network. Year 2030 conditions have been analyzed in this evaluation. Section 33-69.52 of the City of Margate Code of Ordinances establishes that local roads must maintain a minimum Level of Service (LOS) of C, which corresponds to low-to-moderate delays and minimal congestion on the subject transportation facilities. Existing intersection turning movement data and projected project traffic movements were used to forecast future link volumes along local roadway links within the project boundaries.

Section 5-195(b)(2) of the Broward County Land Development Code contains adopted generalized service volumes for local collectors and local roadways. Table 6 below provides the Generalized Volumes for non-Trafficway Roadways provided in this Section of the Broward County Land Development Code.

Table 6: Generalized Service Volumes

	4-Lane Local Collector	2-Lane Local Collector	2-Lane Local	2-Lane Cul-de-sac
Generalized Volume (ADT)	6,500-20,400	3,000-8,500	800-4,000	0-300

For the purposes of this evaluation, Pinewalk Drive North is assumed to be a two-lane local collector road, and the Pod C Road and Pod A Road are assumed to be 2-lane local roads. The ADT generalized service volume for the 2-lane collector is 8,500 trips per day and for the 2-lane local road is 4,000 trips per day, which represents the maximum LOS D threshold for a road with these characteristics. Consistent with HCM methodologies, a 75% factor was applied to this upper limit LOS D maximum service volume to determine the appropriate LOS C maximum service volume. These ADT service volumes were used to determine the volume to capacity ratio and level of service for the study roadways during the proposed future conditions.

Baseline traffic volume projections were determined on these roadway links based on the approach/departure intersection volumes at the corresponding intersections. To convert the peak hour volumes to an AADT future volume, a k-factor of 0.09 was applied to the higher of the two peak hour volumes (AM or PM peak hour volume). Using the future projected volumes and the generalized service volumes determined for each link, a volume-to-capacity ratio was calculated for future conditions. If the v/c ratio is below 0.75, the roadway is assumed to operate at LOS C or better.

Table 7 summarizes the results of this LOS analysis, identifying the projected volumes and the corresponding LOS and delay on local roadways in 2030 with full buildout of the proposed project.

Table 7: Local Roadway LOS Analysis

Roadway	From	To	Laneage	Daily Max Service Volume	Two-Way 2030 Vol		Calculated AADT	v/c
					AM Peak Hour	PM Peak Hour		
Pinewalk Dr. N	Rock Island Rd.	Pinewalk Dr. S	2L	8,500	157	135	1,744	0.21
Pinewalk Dr. S	Rock Island Rd.	Holiday Springs Blvd.	2L	8,500	252	242	2,800	0.33
Pod C Rd.	Pinewalk Dr. N	Rock Island Rd.	2L	4,000	79	80	889	0.22
Pod A Rd.	Pod B Rd.	Pinewalk Dr. N	2L	4,000	153	155	1,722	0.43

As summarized in the table above, all the local roads that were evaluated are anticipated to have a v/c of less than 0.75 (in fact, all are projected to have a v/c of less than 0.5). Therefore, all will operate within the City’s LOS C standard.

SUMMARY

Kimley-Horn and Associates has prepared a study to evaluate the impact of development of the proposed Carolina Club project in Margate, Florida.

The overall site is bounded to the north by Sample Road, the east by Rock Island Road, and the west and south by Holiday Springs Boulevard. The site is currently vacant and is proposed to be redeveloped with 57,500 square feet of commercial use, 507 multi-family mid-rise residential units, 377 single family attached residential units, and open space. The proposed redevelopment is expected to generate 7,902 net external daily trips, 594 net new external AM peak hour trips (+218 in, +376 out) and 579 net new external PM peak hour trips (+316 in, +263 out).

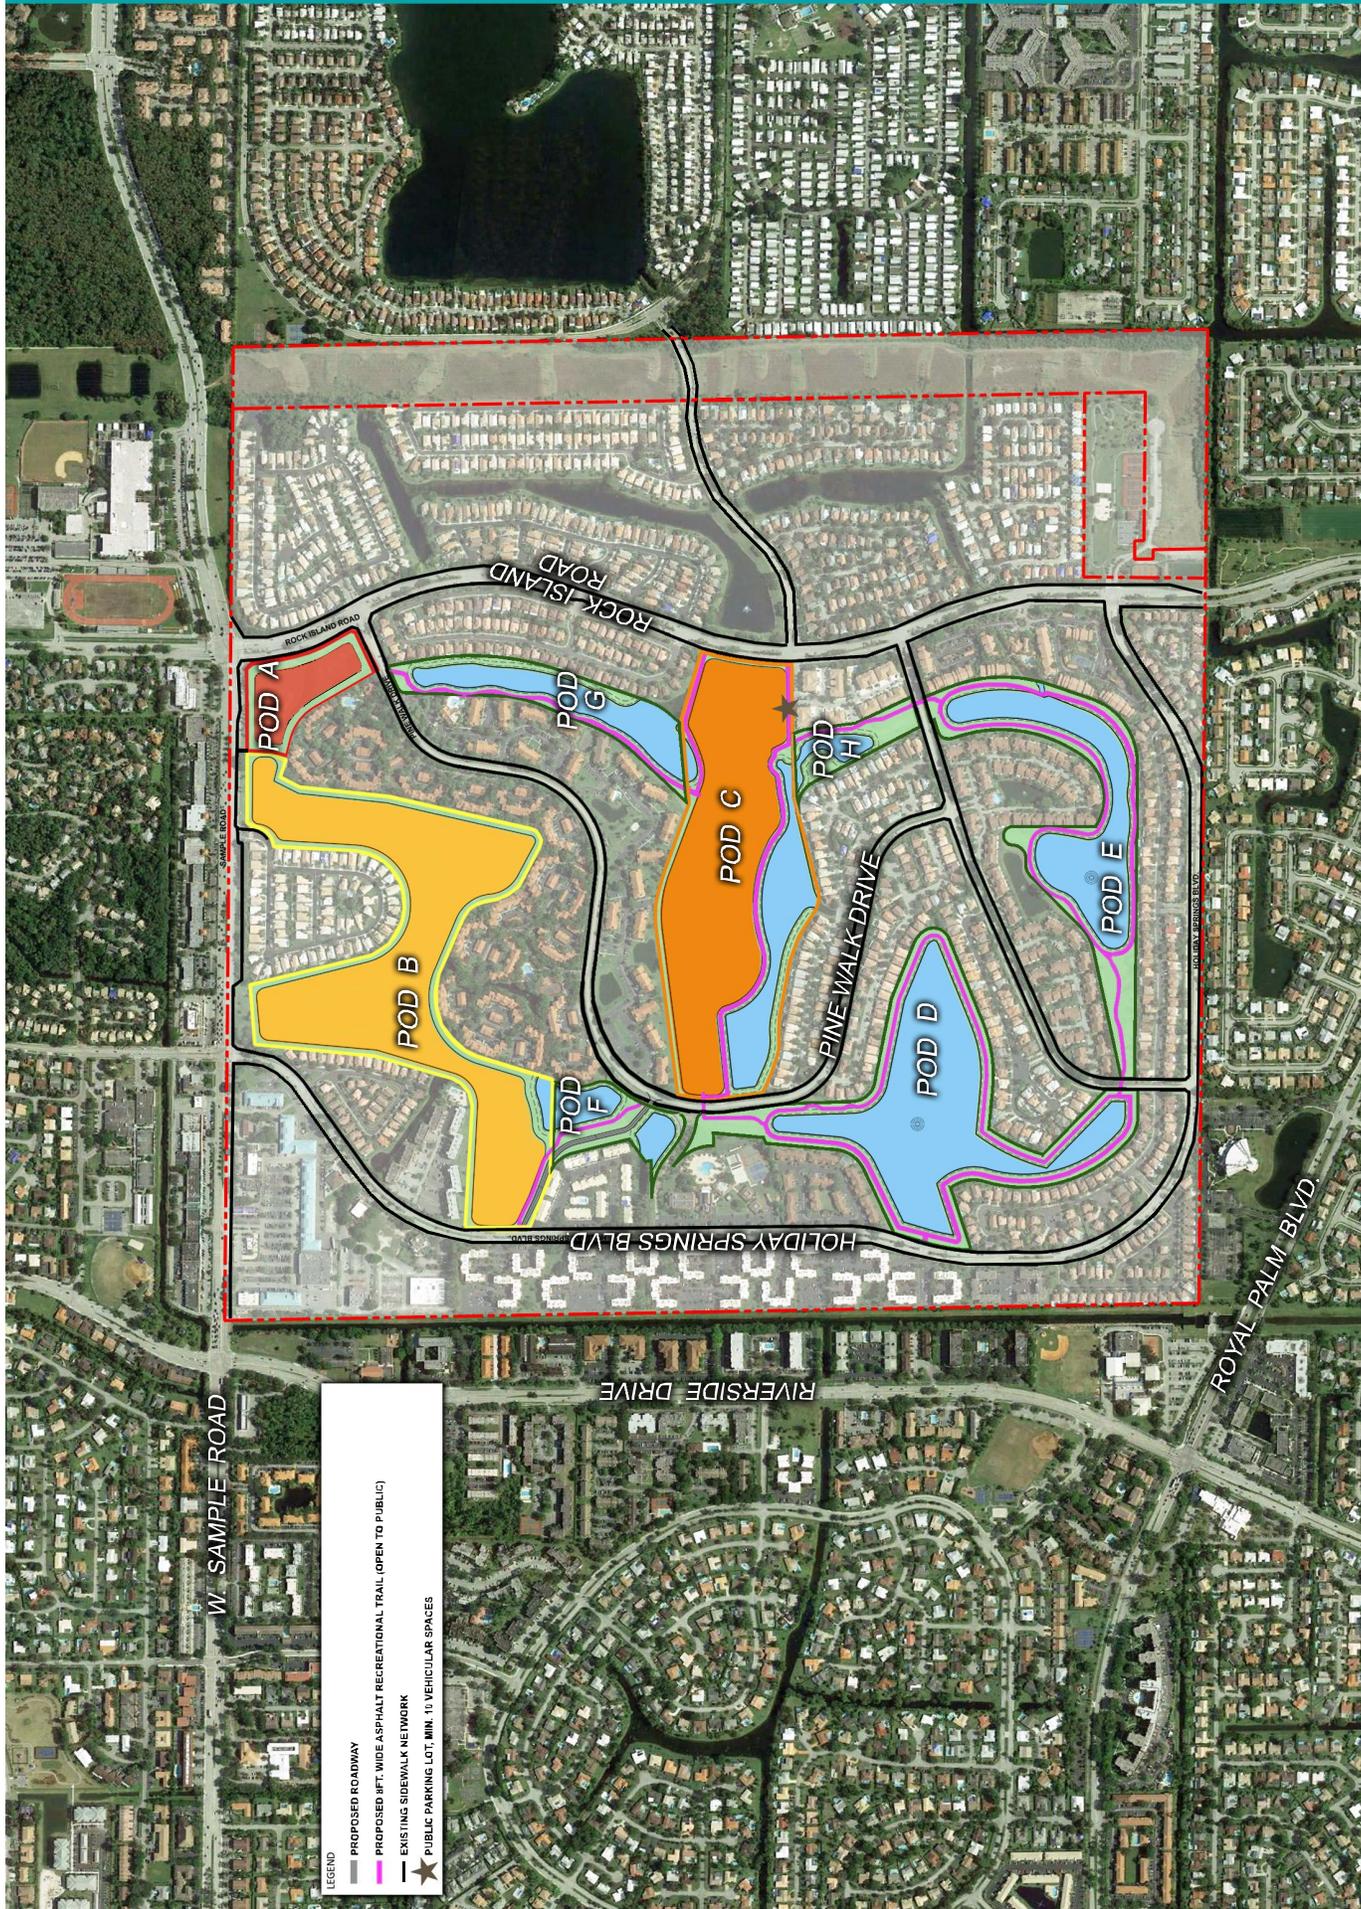

A site-specific traffic analysis has been undertaken to evaluate impacts on the surrounding transportation network. Level of service has been evaluated on fifteen intersections adjacent to the site. The analysis identifies existing LOS and delay, future background LOS and delay, and total future LOS and delay upon buildout of the project. The results of the evaluation of the surrounding transportation network indicate that the following intersections are anticipated to operate at LOS F during future background conditions (without project traffic):

- Rock Island Road & Pinewalk Drive North (AM and PM Peak Hour)
- Rock Island Road & NW 30th Street (AM Peak Hour)
- Riverside Drive & Royal Palm Boulevard (AM and PM Peak Hour)

No additional intersections will operate at LOS F during total future conditions (with project traffic added). The analysis of local roadways (non-Trafficways roadways) indicates that all are anticipated to meet LOS standards during total future conditions.

**Subject: Carolina Club Residential
Study Methodology – Traffic Impact Analysis
KH #241158000**

The above-referenced project is located within an area bounded by Sample Road on the north, Rock Island Road on the east, and Holiday Springs Boulevard on the west in the City of Margate, Florida. The proposed plan of development includes redevelopment of certain portions of the site that currently contain golf course uses to include a mix of multifamily, townhome and commercial uses.

Kimley-Horn and Associates has been retained to undertake a traffic analysis for the currently-proposed program of development. Following is a summary of the methodology that will be used to undertake this traffic analysis.

- 1. Trip generation:** The trip generation potential for the existing and proposed uses will be calculated using rates and equations published by the Institute of Transportation Engineers (ITE) in the *Trip Generation Manual, Eleventh Edition*. The calculations will include calculation of internal capture between uses and pass-by capture based upon methodologies and data published in ITE's *Trip Generation Handbook, Third Edition*. Table 1 summarizes the trip generation calculation for the proposed uses on site:
- 2. Trip distribution/assignment:** Overall trip distribution percentages will be determined based on a review of the complementary land uses and roadway network proposed to be in place at the time of buildout. This assignment will be carried out through one mile from the site boundary. Figure 1, attached, depicts the preliminary traffic assignment on the surrounding transportation system.
- 3. Buildout Year:** A buildout year of 2030 will be used for the purposes of this analysis.

Table 1: Trip Generation Calculations

Single-Family Attached Housing		7.2 trips/DU		0.48 trips/DU (25% in, 75% out)			0.57 trips/DU (59% in, 41% out)			0.0%

4. **Data collection:** AM (7:00 AM – 9:00 AM) and PM (4:00 PM – 6:00 PM) peak period turning movement counts were collected on one (1) weekday at the study intersections. Following is the list of the sixteen (16) intersections that will be evaluated in this analysis:
1. Riverside Drive & Sample Road
 2. Holiday Springs Boulevard & Sample Road
 3. Project Driveway & Sample Road
 4. Rock Island Road & Sample Road
 5. Rock Island Road & Pinewalk Drive North/NW 33rd Street
 6. Pinewalk Drive North & Project Access
 7. Holiday Springs Boulevard & Potential Future E-W Connection
 8. Potential Future E-W Connection & Parcel 1 Driveway
 9. Potential Future E-W Connection + Pinewalk Drive North
 10. NW 30th Street & Rock Island Road
 11. Pinewalk Drive North & Pinewalk Drive South
 12. Rock Island Road & Pinewalk Drive South
 13. Pinewalk Drive South & Holiday Springs Boulevard
 14. Rock Island Road & Holiday Springs Boulevard
 15. Riverside Drive & Royal Palm Boulevard
 16. Royal Palm Boulevard & Rock Island Road

From count data that was collected at the existing intersections, peak hour traffic volumes will be determined. For any counts conducted outside of the peak season (January – March), the Peak Season Conversion Factor (PSCF) published by FDOT will be applied.

The City of Margate has a standard that includes analysis of all intersections within a one-mile radius of the site. It would be unrealistic to perform analyses of all intersections within that distance, and many of those intersections, especially further from the site boundary, have a 10% or less assignment of project traffic traveling through the intersection. The above list of intersections identifies those in which the project traffic may have an impact on Level of Service and operations. All other intersections have been excluded because it is anticipated that the project would have a *de minimis* impact on intersection operations.

5. **Future Background (Non-Project) Volumes:** Future background volumes will be determined by adding compounded annual growth rate determined using historical AADT data for roadway links within the vicinity of the project site. At a minimum, the growth rate applied will be no less than 0.5%. Additionally, project traffic generated by relevant approved projects as identified by the City and/or its consultant, if applicable, will be assigned to the project study intersections.
6. **Total Future Volumes:** Total future volumes will be determined by adding future background volumes and project traffic volumes at each of the study intersections.
7. **Intersection LOS Analysis:** Intersection LOS analyses will be conducted for Existing Peak Season, Future Background Peak Season and Future Total Peak Season Conditions using Synchro or HCS software. Summary tables will be prepared to report the Highway Capacity Manual (HCM)-based LOS and delay for each approach and the overall intersection (if available; no overall intersection LOS will be reported for two-way stop-controlled unsignalized intersections).
8. **Transit/Multi-Modal Options:** The location and frequency of transit service on nearby corridors will be quantified, and any modifications to that service identified in Broward County's 5-Year Improvement Program will be reported.
9. **Queuing Evaluation:** If gated access is proposed at any locations within the site plan, or if any uses within the commercial portion of the project contain drive-through lanes, a queuing analysis will be conducted to determine whether or not sufficient vehicle storage is provided.

10. Mitigation: Following a determination of project impacts, the Applicant will review potential mitigation measures with City staff and the City consultant, if needed, to evaluate feasibility and appropriateness of these measures. Included in this evaluation will be a determination of the need for turn lanes at adjacent and surrounding intersections.

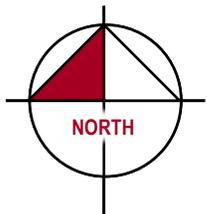

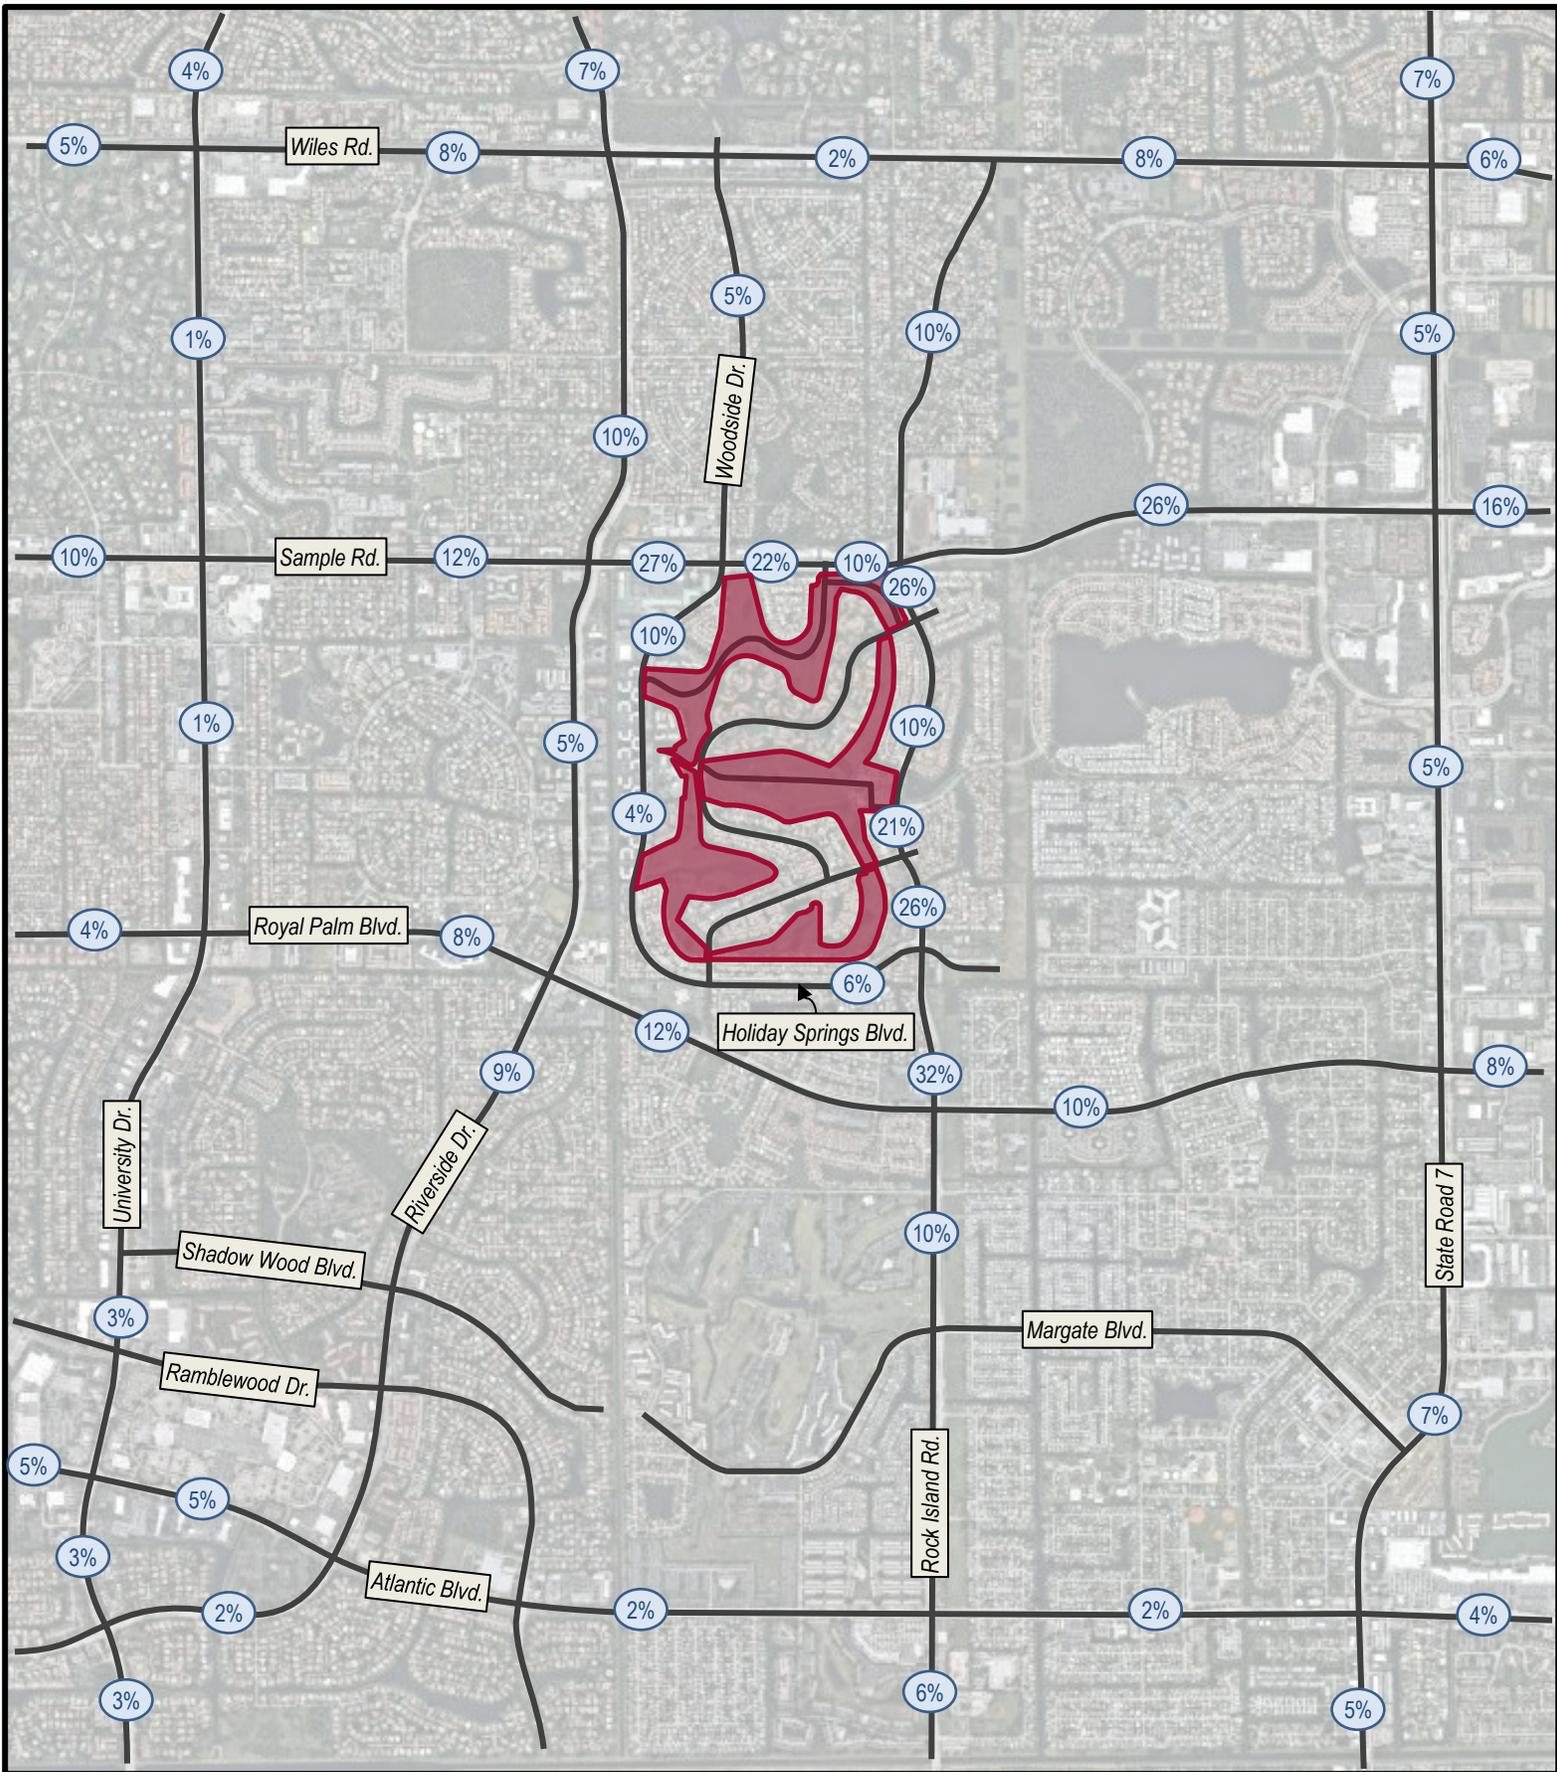

The data collection, calculations, analyses and results will be summarized in a written report for City review. Relevant tables, charts, figures, worksheets, and a current copy of the site plan will be included in the summary report.

Please review the methodology for this analysis as outlined above and indicate your concurrence by signing in the space below. Should you have questions or comments regarding the proposed methodology, please call me via phone at (561) 840-0248 or via e-mail at chris.heggen@kimley-horn.com.

Land Use: 821

Shopping Plaza (40-150k)

Description

A shopping plaza is an integrated group of commercial establishments that is planned, developed, owned, and managed as a unit. Each study site in this land use has between 40,000 and 150,000 square feet of gross leasable area (GLA). The term “plaza” in the land use name rather than “center” is simply a means of distinction between the different shopping center size ranges. Various other names are commonly used to categorize a shopping plaza within this size range, depending on its specific size and tenants, such as neighborhood center, community center, and fashion center.

Its major tenant is often a supermarket but many sites are anchored by home improvement, discount, or other stores. A shopping plaza typically contains more than retail merchandising facilities. Office space, a movie theater, restaurants, a post office, banks, a health club, and recreational facilities are common tenants. A shopping plaza is almost always open-air and the GLA is the same as the gross floor area of the building.

The 150,000 square feet GLA threshold value between shopping plaza and shopping center (Land Use 820) is based on an examination of trip generation data. For a shopping plaza that is smaller than the threshold value, the presence or absence of a supermarket within the plaza has a measurable effect on site trip generation. For a shopping center that is larger than the threshold value, the trips generated by its other major tenants mask any effects of the presence or absence of an on-site supermarket.

The 40,000 square feet GFA threshold between shopping plaza and strip retail plaza (Land Use 822) was selected based on an examination of the overall shopping center/plaza database. No shopping plaza with a supermarket as its anchor is smaller than 40,000 square feet GLA.

Shopping center (>150k) (Land Use 820), strip retail plaza (<40k) (Land Use 822), and factory outlet center (Land Use 823) are related uses.

Land Use Subcategory

The presence or absence of a supermarket in a shopping plaza has been determined to have a measurable effect on site trip generation. Therefore, data are presented for two subcategories for this land use: sites with a supermarket anchor and sites without a supermarket.

Additional Data

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), British Columbia (CAN), California, Connecticut, District of Columbia, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Minnesota, Nevada, New Jersey, New York, Ontario (CAN), Oregon, Pennsylvania, South Dakota, Texas, Vermont, Virginia, Washington, and Wisconsin.

Land Use: 221

Multifamily Housing (Mid-Rise)

Description

Mid-rise multifamily housing includes apartments and condominiums located in a building that has between four and 10 floors of living space. Access to individual dwelling units is through an outside building entrance, a lobby, elevator, and a set of hallways.

Multifamily housing (low-rise) (Land Use 220), multifamily housing (high-rise) (Land Use 222), off-campus student apartment (mid-rise) (Land Use 226), and mid-rise residential with ground-floor commercial (Land Use 231) are related land uses.

Land Use Subcategory

Data are presented for two subcategories for this land use: (1) not close to rail transit and (2) close to rail transit. A site is considered close to rail transit if the walking distance between the residential site entrance and the closest rail transit station entrance is ½ mile or less.

Additional Data

For the six sites for which both the number of residents and the number of occupied dwelling units were available, there were an average of 2.5 residents per occupied dwelling unit.

For the five sites for which the numbers of both total dwelling units and occupied dwelling units were available, an average of 96 percent of the total dwelling units were occupied.

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

It is expected that the number of bedrooms and number of residents are likely correlated to the trips generated by a residential site. To assist in future analysis, trip generation studies of all multifamily housing should attempt to obtain information on occupancy rate and on the mix of residential unit sizes (i.e., number of units by number of bedrooms at the site complex).

The sites were surveyed in the 1990s, the 2000s, the 2010s, and the 2020s in Alberta (CAN), California, District of Columbia, Florida, Georgia, Illinois, Maryland, Massachusetts, Minnesota, Montana, New Jersey, New York, Ontario (CAN), Oregon, Utah, and Virginia.

Single-Family Attached Housing

Description

Single-family attached housing includes any single-family housing unit that shares a wall with an adjoining dwelling unit, whether the walls are for living space, a vehicle garage, or storage space.

Additional Data

The database for this land use includes duplexes (defined as a single structure with two distinct dwelling units, typically joined side-by-side and each with at least one outside entrance) and townhouses/rowhouses (defined as a single structure with three or more distinct dwelling units, joined side-by-side in a row and each with an outside entrance).

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in British Columbia (CAN), California, Georgia, Illinois, Maryland, Massachusetts, Minnesota, New Jersey, Ontario (CAN), Oregon, Pennsylvania, South Dakota, Utah, Virginia, and Wisconsin.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.
